

AI BUILD CHALLENGE — BENGALURU

INDUSTRY PROBLEM STATEMENT

Presented by Masters' Union Ventures | Powered by Hackingly

18 September 2026 · Startup Park, Koramangala, Bengaluru

PS-002 · REVLAG IN-APP AGENT TRACK

Zero-Touch App Understanding

INDUSTRY PARTNER: REVLAG

THE CHALLENGE

RevRag's in-app agent lives inside host apps through an SDK — it sees the screen, understands the user, and acts on their behalf. To help users well, it needs to know the app as deeply as someone who built it: every screen, what each one does, how they connect, and how the app looks and feels. Today, nobody builds this knowledge automatically — someone has to record every flow by hand, which is slow, incomplete, and breaks the moment the app updates. The challenge is to build an AI system that can explore an unfamiliar Android app entirely on its own and come away with a complete, structured understanding of it — its screens, elements, journeys, and brand and design language.

YOUR MISSION

Build an AI-powered solution that addresses this problem and demonstrates a clear, practical use case.

- ▶ Explore an unfamiliar Android app fully hands-off, deciding what to tap, scroll, or fill next
- ▶ Produce a complete, structured App Knowledge Pack covering screens, elements, journeys, and design
- ▶ Keep the output stable across repeat scans and compact enough for another AI to read

WHO IS THE USER?

Primary User: RevRag's in-app agent, and the end users it assists inside host apps

Context: The agent needs deep knowledge of a host app to act on a user's behalf, but that knowledge is normally built by hand and breaks whenever the app updates.

WHAT COULD YOUR SOLUTION DO?

- ▶ Get past login/OTP/KYC gates using valid test data during autonomous exploration
- ▶ Describe each screen's purpose, elements, and form fields in plain language, even without UI roles or labels
- ▶ Extract brand and design details — colors, fonts, spacing, components, tone of voice, light/dark mode — from screenshots and the UI tree
- ▶ Build a viewer showing the app map with each screen's profile next to its screenshot

These are starting points, not limitations. Teams are encouraged to think beyond the suggested directions.

KEY CONSIDERATIONS

- ▶ Exploration must be fully autonomous, with no human recording flows by hand
- ▶ Output must stay stable across repeat scans of the same app
- ▶ Raw UI trees can exceed 1.5 MB, so the knowledge pack must stay compact
- ▶ Should support a rebuild test recreating 2–3 screens from the knowledge pack alone

Resources / APIs / Data: On-device LLM/VLM of your choice; Android (Kotlin) first

BUILD EXPECTATIONS

IDEA → BUILD → ITERATE → TEST → SHIP

You can start building as soon as the problem statement is shared. Come to the venue with approximately 80% of your solution ready. The final product must be built, tested and completed at the venue during the AI Build Challenge.

FINAL EVALUATION: 100% WEIGHTAGE | WORKING PROTOTYPE REQUIRED

Problem Understanding & Relevance • Solution Quality & Problem-Solution Fit • Execution & Working Prototype • Innovation / Use of AI • Feasibility & Potential Impact

Don't just talk about AI. Build with it.
